

On-Site Meeting Services

Audience Response Systems (ARS)

ARS is an effective way to capture and evaluate real-time responses from your audience. Participants are given handheld devices which record their answers to questions asked by the presenter. These answers can be used to evaluate comprehension, refine marketing tactics, and develop educational objectives. ARS is simple and cost-effective way to keep your audience engaged and encourage valuable discussion.

Virtual Office

With all the time you spend traveling, wouldn't it be great to have your own office on-site? Our Virtual Office enables meeting planners to have all the office equipment necessary to run their meetings smoothly. The Virtual Office Package includes a high-speed laser printer, photo copier and digital fax machine. This package can include internet access and networking for your entire staff.

Digital Signage

With digital signage you have the ability to display agendas, speaker biographies, hotel maps, venue information, and even the weather for tomorrow. You can place these signs around the hotel in key gathering places like elevator lobbies, reception areas, and break locations. If you have to communicate with your audience quickly and dynamically, consider this sophisticated information tool at your next event.

Simultaneous Interpretation

Simultaneous Interpretation is a necessary component when translating multiple languages between attendees and presenters. Professional translators listen to and translate the presentation into their target language. Recording a meeting with Simultaneous Interpretation is also a recommended way to communicate your message with an international audience who may not be able to attend.
